RE: **TTM 34760 - Localized Significance Thresholds Analysis**

The purpose of this Localized Significance Threshold Analysis (LST) is to identify maximum localized thresholds for TTM 34760 and is an addendum study to the project Air Quality Conformity Assessment (Source: Air Quality Conformity Assessment – TPM 34760 – Investigative Science and Engineering – May 22, 2008). This report utilizes construction data from that report and does not modify any of the original findings but provides additional information requested by the City.

The proposed (TTM 34760) development project seeks to develop approximately 34 single family residential parcels with Open Space on an approximate 64 acre site located within the City of Corona and the County of Riverside. The project applicant is also seeking to annex the portion of the project located within the County of Riverside.

In June 2003 South Coast Air Quality Management District (SCAQMD) proposed a methodology for calculating Localized Significance Thresholds (LSTs) for NO_2, CO and fugitive $PM_{2.5}$ and PM_{10}. The LST methodology was developed to be used as a tool to assist lead agencies to analyze localized impacts associated with project-specific level proposed projects and would not be applicable to regional projects such as general plans. Recently, the LST methodology was updated to incorporate the most recent ambient air quality standards (July 2008). The LST methodology is often utilized by the City of Corona for projects requiring CEQA review.

SCAQMD developed mass rate look-up tables for projects less than five acres to assist agencies with development of LSTs, however LST guidelines recommend project specific air quality dispersion modeling for projects greater than five acres (http://aqmd.gov/ceqa/handbook/LST/LST.html). Air dispersion modeling utilizing the Environmental Protection Agency's Industrial Source Complex Short Term Version 3 (ISCST3) is the preferred dispersion modeling software because of its ability to incorporate meteorological inputs as well as multiple source and receptor locations.

Per the requirements of SCAQMDs LSTs methodology, emissions for gases in attainment such as NO_2 and CO are calculated by adding emission impacts from the project development to the peak background ambient NO_2 and CO concentrations and comparing the total concentration

to the most stringent ambient air quality standards. Per SCAQMD Rule 403, emissions for non-attainment particulate matter such as PM 10 and PM 2.5 can produce no more than 10.4 µg/m^3 (Source: SCAQMD Final Localized Significance Threshold Methodology, July 2008). Ambient Air quality data is shown below in Table 1.

Table 1: Ambient Air Quality Standards (Modified to Show LST Pollutants Only)

Ambient Air Quality Standards						
Pollutant	Average Time	California Standards[1]		Federal Standards[2]		
		Concentration[3]	Method[4]	Primary[3,5]	Secondary[3,6]	Method[7]
Respirable Particulate Matter (PM10)	24 Hour	50 µg/m3	Gravimetric or Beta Attenuation	150 µg/m3	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	20 µg/m3		-		
Fine Particulate Matter PM2.5	24 Hour	No Separate State Standard		35 µg/m3	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	12 µg/m3	Gravimetric or Beta Attenuation	15 µg/m3		
Carbon Monoxide (CO)	8 hour	9.0 ppm (10mg/m3)	Non-Dispersive Infrared Photometry (NDIR)	9 ppm (10 mg/m3)	None	Non-Dispersive Infrared Photometry
	1 hour	20 ppm (23 mg/m3)		35 ppm (40 mg/m3)		
	8 Hour (Lake Tahoe)	6 ppm (7 mg/m3)		-	-	-
Nitrogen Dioxide (NO_2)	Annual Arithmetic Mean	0.030 ppm (57 µg/m3)	Gas Phase Chemiluminescence	0.053 ppm (100 µg/m3)	Same as Primary Standard	Gas Phase Chemiluminescence
	1 Hour	0.18 ppm (339 µg/m3)				

1. California standards for ozone, carbon monoxide (except Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, suspended particulate matter—PM10, PM2.5, and visibility reducing articles, are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

2. National standards (other than ozone, particulate matter, and those based on annual averages or annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest eight hour concentration in a year, averaged over three years, is equal to or less than the standard. For PM10, the 24 hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m3 is equal to or less than one. For PM2.5, the 24 hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard. Contact U.S. EPA for further clarification and current federal policies.

3. Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

4. Any equivalent procedure which can be shown to the satisfaction of the ARB to give equivalent results at or near the level of the air quality standard may be used.

Source: California Air Resources Board (4/1/08)

Utilizing the ISCST3 dispersion model, project level air quality emissions for NO_x, CO, $PM_{2.5}$ and PM_{10} emissions were calculated utilizing a single volume source over the project site and was assumed to occur over the entire site. Emission rates were taken from the project Air Quality report but were normalized to a worst-case hourly level produced in an eight our workday. A polar coordinate system was utilized for sources because there is a high level of residential uses to the north of the project site. The model output files are attached to the end of this letter.

Ambient Air Quality thresholds are not given for NO_x as is typically quantified for project related emission outputs. This is because NO_x emitted during the combustion process primarily consists of NO and NO_2. Initially it is assumed that 5% of NO_x is NO_2 and the remaining NO gradually is converted to NO_2 through photochemical and reactions with ozone O_3

(*Source: A Chemically Reactive Plume Model for the NO-NO_2-O_3 System - Atmospheric Environment 24A – Arellano, J.V., A.M. Talmon, and P.J.H Builtjes).* It was found that the downwind conversion from NO to NO_2 is quantified through the NO_2/NO_x ratio calculated from the emission release point. The reduction ratios are shown in Table 2 below.

Table 2: Three-Year Ambient Air Quality Summary near the Project Site

Downwind Distance (m)	NO_2/NO_x Ratio
20	0.053
50	0.059
70	0.064
100	0.074
200	0.114
500	0.258
1000	0.467
2000	0.75
3000	0.9
4000	0.978
5000	1
Source: A Chemically Reactive Plume Model for the NO-NO_2-O_3 System - Atmospheric Environment 24A – Arellano, J.V., A.M. Talmon, and P.J.H Builtjes	

Ambient Data was obtained from the California Environmental Protection Agency's Air Resources Board Website (Source: http://www.arb.ca.gov/adam/welcome.html). Table 3 identifies the closest criteria pollutants monitored to the project as well as identifies the relative distance from the project site. As can be seen from the project data the 2007 data for Norco is unusually high. This number is not representative of the ambient air quality data and should be thrown out as it was most likely due fires near the monitoring equipment

Table 3: Three-Year Ambient Air Quality Summary near the Project Site

Pollutant	Closest Recorded Ambient Monitoring Site	Relative Distance to the Project Site (miles)	Averaging Time	CAAQS	NAAQS	2006	2007	2008
CO (ppm)	Riverside Rubidoux	15	8 Hour	9 ppm	9 ppm	2.29	2.93	1.86
PM10 (µg/m3)	Norco	6	24 Hour	50 µg/m3	150 µg/m3	74	332	86
PM2.5 (µg/m3)	Riverside Rubidoux	15	24 Hour	-	35 µg/m3	68.4	75.6	53.3
NO2 (ppm)	Riverside Rubidoux	15	1 Hour	0.18 ppm	-	0.076	0.072	0.092

LST concentrations for $PM_{2.5}$ and PM_{10} is 10.4 µg/m^3 however, to derive LST concentrations for NO_2 and CO, the difference between the worst case ambient air quality standard and the ambient concentration for the pollutant must be determined. The following equation is used:

$$C_{pc} = C_{AAQS} - C_b$$

Where: C_{PC} = Project contribution emission levels in micrograms per cubic meter; and

C_b = Background Concentration measured at the closest air quality monitorin station in micrograms per cubic meter; and

C_{AAQS} = is the limiting state or federal standards in micrograms per cubic meter.

Table 4 below identifies the localize significance threshold and compares it to the project contributions. Based upon this analysis, the proposed project would exceed PM_{10} and $PM_{2.5}$ thresholds of 10.4 µg/m^3 and would require mitigation per SCAQMD Rule 403.

Table 4: LST Findings

Pollutant	Averaging Time	Threshold	Worst Case Background Ambient Air Quality Data		LST (µg/m3)	Project Contribution (µg/m3)						Significant ?
			Data	(µg/m3)		100 (m)	200 (m)	300 (m)	400 (m)	800 (m)	1000 (m)	
CO	8 Hour	9 ppm (10000 µg/m^3)	2.93 ppm	3,255	6745	0	0	21	14	5	4	No
PM10	24 Hour	10.4 µg/m3	86 µg/m^3	86	10.4	0	0	1	0	0	0	No
PM2.5	24 Hour	10.4 µg/m3	75.6 µg/m^3	75.6	10.4	0	0	1	0	0	0	No
NO2 (Corrected utilizing NO_2/NO_x Ratio)	1 Hour	0.18 ppm (339 µg/m^3)	.092 ppm	173.2	165.8	0	0	76	55	23	18	No

As shown from the ISCST3 air quality modeling, Localized Significance Thresholds will not be exceeded during the construction of the proposed project. No additional mitigation will be necessary.

Regards,

**Intermediate Terrain Processing is Selected

**Model Is Setup For Calculation of Average CONCentration Values.

  --  SCAVENGING/DEPOSITION LOGIC --
**Model Uses NO DRY DEPLETION.  DDPLETE =  F
**Model Uses NO WET DEPLETION.  WDPLETE =  F
**NO WET SCAVENGING Data Provided.
**NO GAS DRY DEPOSITION Data Provided.
**Model Does NOT Use GRIDDED TERRAIN Data for Depletion Calculations
```

```
**Model Uses URBAN Dispersion.

**Model Uses User-Specified Options:
          1. Final Plume Rise.
          2. Stack-tip Downwash.
          3. Buoyancy-induced Dispersion.
          4. Not Use Calms Processing Routine.
          5. Not Use Missing Data Processing Routine.
          6. Default Wind Profile Exponents.
          7. Default Vertical Potential Temperature Gradients.

**Model Assumes Receptors on FLAT Terrain.

**Model Assumes No FLAGPOLE Receptor Heights.

**Model Calculates  1 Short Term Average(s) of:  24-HR

**This Run Includes:     1 Source(s);      1 Source Group(s); and     288
Receptor(s)

**The Model Assumes A Pollutant Type of:  PM10

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)

**Misc. Inputs:  Anem. Hgt. (m) =     6.10 ;    Decay Coef. =    0.000     ;    Rot.
Angle =     0.0
                 Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

**Approximate Storage Requirements of Model =     1.2 MB of RAM.

**Input Runstream File:          valpm25.inp

**Output Print File:             valpm25.out

**Detailed Error/Message File:   ERRORS.OUT

**Intermediate Terrain Processing is Selected

**Model Is Setup For Calculation of Average CONCentration Values.

  --  SCAVENGING/DEPOSITION LOGIC --
**Model Uses NO DRY DEPLETION.  DDPLETE =  F
**Model Uses NO WET DEPLETION.  WDPLETE =  F
**NO WET SCAVENGING Data Provided.
**NO GAS DRY DEPOSITION Data Provided.
**Model Does NOT Use GRIDDED TERRAIN Data for Depletion Calculations

**Model Uses URBAN Dispersion.

**Model Uses User-Specified Options:
           1. Final Plume Rise.
           2. Stack-tip Downwash.
           3. Buoyancy-induced Dispersion.
           4. Not Use Calms Processing Routine.
           5. Not Use Missing Data Processing Routine.
           6. Default Wind Profile Exponents.
           7. Default Vertical Potential Temperature Gradients.

**Model Assumes Receptors on FLAT Terrain.

**Model Assumes No FLAGPOLE Receptor Heights.

**Model Calculates  2 Short Term Average(s) of:   1-HR   8-HR
```

**This Run Includes: 1 Source(s); 1 Source Group(s); and 288 Receptor(s)

**The Model Assumes A Pollutant Type of: OTHER

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)

**Misc. Inputs: Anem. Hgt. (m) = 6.10 ; Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC ;
Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 1.2 MB of RAM.

**Input Runstream File: valnox.inp

**Output Print File: valnox.out

**Detailed Error/Message File: ERRORS.OUT

**File Created for Event Model: EVENTEXP.INP

**Intermediate Terrain Processing is Selected

**Model Is Setup For Calculation of Average CONCentration Values.

  --  SCAVENGING/DEPOSITION LOGIC --
**Model Uses NO DRY DEPLETION.  DDPLETE =  F
**Model Uses NO WET DEPLETION.  WDPLETE =  F
**NO WET SCAVENGING Data Provided.
**NO GAS DRY DEPOSITION Data Provided.
**Model Does NOT Use GRIDDED TERRAIN Data for Depletion Calculations
```

```
**Model Uses URBAN Dispersion.

**Model Uses User-Specified Options:
          1. Final Plume Rise.
          2. Stack-tip Downwash.
          3. Buoyancy-induced Dispersion.
          4. Not Use Calms Processing Routine.
          5. Not Use Missing Data Processing Routine.
          6. Default Wind Profile Exponents.
          7. Default Vertical Potential Temperature Gradients.

**Model Assumes Receptors on FLAT Terrain.

**Model Assumes No FLAGPOLE Receptor Heights.

**Model Calculates  1 Short Term Average(s) of:  24-HR

**This Run Includes:     1 Source(s);      1 Source Group(s); and     288
Receptor(s)

**The Model Assumes A Pollutant Type of:  PM10

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)

**Misc. Inputs:  Anem. Hgt. (m) =     6.10 ;    Decay Coef. =    0.000     ;    Rot.
Angle =     0.0
                 Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

**Approximate Storage Requirements of Model =     1.2 MB of RAM.

**Input Runstream File:          valpm102.inp

**Output Print File:             valpm102.out

**Detailed Error/Message File:   ERRORS.OUT
